

## **PhaseSpace's Recap Allows Users to Clean-Up Data Better than Ever Before**

*Errors and glitches in motion capture data become obsolete with PhaseSpace's Recap. Using this program can greatly cut the costs of data clean-up for many current and potential clients.*

San Leandro, California (Month, Date, Year) – PhaseSpace developers are prepared to release the newest addition to their growing line of motion capture technology. *Recap* will be available on February 00, 2010. This release is a huge step in perfecting the imperfect motion capture process, allowing clients to easily and accurately fill in missing data from any capture.

A major component of *Recap* is *Skeleton*, a tool used on collected data to find and maintain proper joint locations on the human body. *Skeleton* implements a constraint system where, even when markers were occluded during the capture, gaps are filled in flawlessly, generating extremely fluid human movement.

*Recap* was built to be flexible, so that when clients make requests, PhaseSpace developers can adjust the program to specifically fit their needs. Due to advanced LED technology, PhaseSpace was able to create a clean-up system that is faster and more accurate than competitor clean-up systems. In fact, one current client used *Recap* to clean up data collected from a competitor's motion capture technology.

The possibilities are endless for the future of *Recap*. PhaseSpace would like to get feedback from clients before adding or detracting any components of the system. One prospective addition to the system might be integrating silhouette data where only a few markers on the head, gloves, and feet, drive the entire skeleton. As Dimitri Derevyanko, a developer of the *Recap* system put it, "Due to its fully modular design, we can virtually make it do anything..."

About PhaseSpace, Inc:

PhaseSpace is composed of scientists and engineers who consistently prove they are the best and brightest in the industry by coming up with the most advanced systems ever seen in motion capture. They have revolutionized the motion capture process into one that is easy, affordable, and fast.
